Strong Tailwinds for Commercial Real Estate

- Macroeconomic conditions
  - Low and stable inflation
  - Accommodative monetary policy
- Foreign economic conditions – relative strength in the United States compared with the rest of the world
- Demographics – trends toward greater urbanization and a preference among the large cohort of millennials to seek multifamily accommodations
What *Could* Cause a Reversal in Commercial Real Estate Prices?

- Government-sponsored enterprises (GSEs)
  - GSEs and their securitized vehicles currently hold or guarantee 44 percent of multifamily loans
  - Any GSE reform proposal that caused them to alter their participation in this market could impact market

- 2017 annual stress test includes a hypothetical scenario of a significant decline in CRE prices

- A third potential concern could arise if inflation and interest rates moved much higher, and at a faster pace
Financial Stability and Commercial Real Estate

- In some past recessions CRE downturn has propagated an initial adverse shock and by constraining financial intermediaries, worsened the subsequent economic downturn.

- Given low capitalization rates – what if tailwinds become headwinds?

- Regulatory community must consider whether the system is resilient enough to withstand potential CRE downturn.

Figure 5: Unemployment Rates in the United States and the Euro Area
January 2000 - April 2017

Note: The unemployment rates for the U.S. and Euro Area are defined somewhat differently. One difference is based on age; the U.S. civilian unemployment rate tallies the unemployed share of the labor force age 16 years and older, whereas the Euro Area harmonized unemployment rate calculates the unemployed share of the labor force age 15 to 74. For both definitions, unemployed persons must be actively seeking work. The April 2017 rate for the Euro Area is not yet available.

Trends Have Supported Commercial Real Estate Prices

- Macroeconomic and demographic trends are qualitatively consistent with the strong commercial real estate markets we see in many parts of the country.
- It is harder to know if these conditions warrant the extent of price increase we have seen to date.
- Very hard to distinguish how much of the price gain is the result of the favorable fundamentals, and how much reflects an abundance of optimism by investors.
- Next – consider the possibility that low capitalization rates could experience a significant reversal.

Potential of GSE Reform

- GSEs’ large and growing footprint in multifamily commercial real estate
  - Is this level of government-sponsored exposure safe?
  - Is this level of government support appropriate?
- Whether, or how, future reform proposals will impact commercial real estate is unclear
- Potential problem if reform proposals require the GSEs to reduce their holdings of multifamily loans

Only a Hypothetical Scenario

- Both the 1990 and the 2007 recessions exhibited very significant declines in commercial real estate prices that aggravated significant negative shocks to the economy.

- One reason that many regulators have increased their focus on commercial real estate as valuations have risen substantially.
How Likely is this Scenario?

- What are the conditions that might lead to a large shock to commercial real estate?
- It is worth considering what type of economic conditions might lead to an eventual negative shock of the sort that is being modeled in the stress test.
- While the severely adverse stress-test scenario does not have a probability attached, it is possible to look at private sector forecasts that provide probability assessments of “tail events,” as well as their most likely outcome.

Conclusion

- While an overheated economy followed by a recession is only one possible scenario, and certainly not my prediction, it helps to illustrate one way in which low cap rates might be of concern in the event of such a reversal.

- Leveraged institutions and government-sponsored entities have significant exposures to commercial real estate.

- While not expecting such a scenario, central bankers are charged with thinking about adverse risks to the economy, and current valuations in real estate are one such risk that I will continue to watch carefully.
