

Guide to the 2016 Diary of Consumer Payment Choice

Federal Reserve Bank of Boston: Consumer Payments Research Center

April 18, 2018

Introduction

The Diary of Consumer Payment Choice (DCPC) is a survey of consumer payment behavior run in conjunction with the University of Southern California's Understanding America Study (UAS). Respondents were randomly assigned a three-day period between September 29th, 2016 and November 2nd, 2016 and asked to track all of their payments using an online questionnaire. Respondents were also asked to report some account balances and income payments on the night before the beginning of their diary period. To the extent possible, attempts were made to ensure that on any given day a representative sample of US residents was actively taking the diary, and any given day can be made statistically representative by using appropriate sample weights. In addition to in-person purchases, respondents were also asked to record their cash holdings, cash deposits, checking transfers, and other exchanges of liquid assets. Respondents were further asked to report income payments. The result is a dataset containing 16,211 unique transactions by 2,848 individuals, including 12,407 expenditures, 1,888 account transfers, and 1,916 income receipts. All in all, the DCPC allows a researcher an unusually clear window into the household finances of the American consumer.

Structure of the survey instrument

The DCPC asked respondents to track all purchases, bills, and movements of cash over a three-day assigned diary period, and enter them into an online survey every evening. Diarists were also asked to report income payments and some account balances the night before the first diary day (diary day 0). Efforts were made to ensure that the sample of respondents was not just representative through the whole of the October 1st to October 31st official sample period, but also representative on any given date. Diarists were provided with optional memory aids to help keep track of the relevant details, and some real-time error checking was automatically performed by the survey instrument.

Modules and duplicates

The instrument is organized in several modules which deal with certain kinds of transactions – for instance, Purchases, Cash Withdrawals, and Checking Transfers. During these modules, respondents are typically asked to list the number of purchases/cash withdrawals/checking transfers/etc they had on a given day, after which they are asked follow-up questions about each individual transaction. The variable `module` can be used to identify which module an observation was originally pulled from. Note that while the modules can have rather suggestive names, one should not rely on the name of the module to identify the type of transaction an observation represents – not all transactions reported in the Purchases module are necessarily "purchases", as some transactions may be recategorized after-the-fact if the respondent makes a mistake. Respondents were asked many followups which are much more reliable means of identifying a transaction's purpose. See **Structure and use of the data** below for more information. In some cases a respondent would report the same transaction in multiple modules. For instance, a respondent might report a utility bill payment in both the Purchases and Bills module. These duplicates are culled from the dataset, and the `module` variable is modified to reflect that a transaction came from multiple parts of the survey. Transactions are considered to be duplicates if they have a matching `prim_key` (primary respondent identifier), `date`, `amnt` (transaction amount), and `pi` (payment instrument) in cases where `pi` is available, and `prim_key`, `date`, and `amnt` in cases where `pi` is not available.

Some notes on the sampling methodology and skip patterns

In order to reduce unwanted heterogeneity in response quality across days due to diary fatigue, some diarists were assigned diary periods beginning on September 29th and September 30th and some diarists were assigned diary periods ending on November 1st and November 2nd. This was to ensure that every individual day in October has an approximately equal mix of diarists completing their 1st, 2nd, and 3rd diary days. For any statistical analysis which attempts to be representative, the "burn-in" days of September 29-31 and the "burn-out" days of November 1-2 should be dropped. These observations are automatically excluded if the provided daily weights are used, but must be excluded manually when using the individual weights – see the **weighting** section below. For more information on the sampling methodology, see the 2016 DCPC Technical Appendix. In order to conserve valuable survey time and prevent the diary from becoming onerous, the diary employs skip patterns to determine whether or not a respondent is asked a given question. In most cases, this is intuitive; a respondent who does not report a credit card payment is not asked about the logo on their credit card. In other cases, however, it can be potentially misleading. For instance, respondents are only asked if they had cash stolen if their reported end of day cash balance fails to match their reported cash transactions (within a margin of error). Thus, in some cases it may be necessary for the researcher to trace variables back to their original diary questions in order to obtain a full understanding of the universe of respondents for a given question.

Structure and use of the data

The DCPC data contains 27,604 unique observations, approximately 60 percent of which represent a single transaction by a single respondent on a single day. Any observation can be uniquely identified by the person, the day, and a constructed variable which orders the transactions within a given day. These variables are `prim_key`, `date`, and `tran`. The variable `diary_day` can be used in place of `date`, if so desired, and is necessary for identifying diary day 0.

The type variable

Any given transaction will have non-missing values for the variable `type`, which identifies what sort of transaction the observation represents. Observations can either represent an expenditure, a transfer, or an income receipt, or serve as a placeholder. Understanding the `type` variable, and its associated `from_account` and `to_account` is integral to properly using the data, so a short guide is included here.

Expenditures

Expenditures are defined to be money moving out of a respondents possession – for instance, purchasing an item at a store. Expenditures generally come from the Purchases or Bills modules, though they may come from other modules as well. A substantial number of merchant categorization followups were asked for each transaction reported in the Purchases and Bills modules to determine what the expenditure was for; all of these followups have been merged into the variables `merch`, `submerch`, `purpose`, and `subpurpose`. Using these variables one can, for instance, identify consumption.

Transfers

Transfers are when money is moved from one account/form to another. In order to identify the actual movement of money, one should make use of the `from_account` and `to_account` variables. Transfers may come from almost any module. For instance, a cash withdrawal would be a transfer from a checking account to cash and would come from the Cash Withdrawals module, while a credit card bill payment could be a transfer from a checking account to a credit account and might come from the Purchases module.

Income

Income is defined as money coming into the respondents possession. Most income is reported in the Income module, though some types of Cash Withdrawal transactions are also considered income – for instance, receiving money from a family member. Note that, unlike other types of transactions, income receipts can be reported on diary day 0.

Placeholders

Every respondent-diary-day has a placeholder observation that contains only the day-level and transaction-level variables; these are inserted into the dataset to ensure that one can filter out observations along any other variable without removing respondents from the dataset. For instance, one can filter out all Transfers and Income receipts (`type = 1` and `type = 2`) without worrying about losing those respondents who had no expenditures.

Dollar amounts

All transactions which represent a movement of money will have a dollar amount associated with them. This dollar amount is stored in the variable `amnt`. Some subjective outlier cleaning has been applied to these dollar amounts, and the original dollar amounts, as originally reported by the respondents, are stored in `amnt_orig`. Dollar amounts were cleaned based on their subjective likelihood given the type of transaction, the respondent's answer to the various merchant followups, the respondent's written answers in some of the "other" boxes in the survey (which are not included in this dataset), and the respondent's answers to some of the questions in the Survey of Consumer Payment Choice (SCPC). In most cases, unrealistically large dollar amounts are the result of an omitted decimal point.¹

Other key variables

Each transaction also includes, when applicable, an amount (variable `amnt`), a time (variable `time`), a payment instrument (variable `pi`) – e.g., cash, credit, check – a merchant category – e.g., financial services, restaurants, transportation – and the device with which the payment was made – e.g., a mobile phone – as well as several other variables related to the payment. With the data so organized, it is a very simple matter to estimate, say, the average value of a cash transaction at a restaurant, or the average number of credit payments in a given month. It may also be possible, under some reasonable assumptions, to generate running balances of the various liquidity accounts in a respondent's possession.

Structure of this document

This code book is arranged both alphabetically and by level of response; variables that apply to a given transaction are listed first, followed by variables that apply to a given diary day, followed by variables that apply to a given diary. Though variables are generally listed alphabetically, within each subcategory the unique identifier for that subcategory is listed first – thus, `prim_key` (mentioned above) is the first variable listed among the individual level variables. A table of contents is provided on page 6.

¹The data contain six transactions of \$20,000 or more that can substantially alter some mean estimates. These transactions are not erroneous.

For each variable, a description is provided which states what it is meant to represent, as well as the coding of the original survey question which can be used to look the question up in the survey questionnaire. When necessary, additional details are provided about how the variable was altered or constructed from the original survey response. Additional histograms and unweighted transaction-level summary statistics are provided for continuous-valued variables, while simple tabulations and codings are provided for categorical variables.

Weighting

To allow for estimations that are representative of the United States, two sets of sample weights are provided in the base dataset. The first set of base weights, `ind_weight`, are individual-level post-stratification weights. The second set of weights, `day_weight`, are day-level weights. All weights are relative weights – they have a mean of 1 and sum to the number of observations in the dataset. When subsetting the data – especially by date – it may be necessary to generate your own weights, and strictly speaking the day weights provided are not appropriate to use when including diary day 0.

For more information about how the weights are constructed and the various type of weights available in `full_weights`, see **2015 Survey and Diary of Consumer Payment Choice Weighting Procedure** (2016) by Marco Angrisani. While this document describes the method for creating the 2015 weights, the general procedure is also applicable to 2016.

Significant changes from 2015

In order to improve measurement, the survey instrument underwent a number of small tweaks from 2015.

- The most significant tweaks occurred in the merchant follow-ups in the purchases module. The addition of new options meant that it was necessary to redefine the `submerch` and `subpurpose` variables relative to 2015. This means that the codings of these variables are now different, and data users must be cautious when attempting to append the two datasets together.
- The variable `automatic` is now populated for all bills, not just bills reported in the bills module.
- Respondents were now given the opportunity to report more than one bill of the same type in the bills module.
- Information was gathered on the specific credit and debit cards possessed by the respondent. Researchers can now identify which cards were used for which transaction. See the variables prefixed with `cc_` and `dc_` below for more information.

[Back to top](#)

amnt

Description

Dollar amount of the transaction, cleaned.

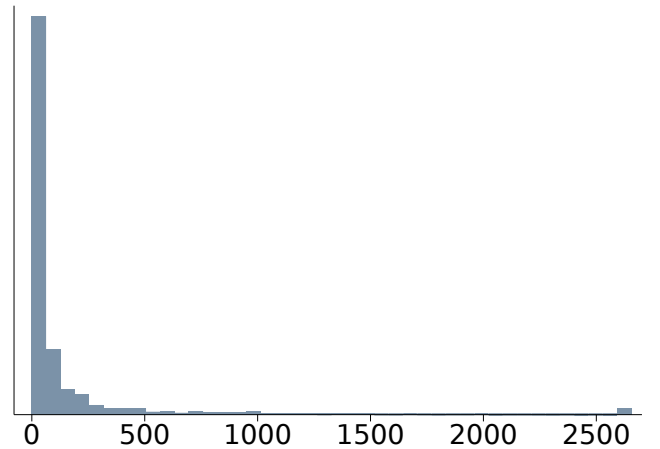

Survey Question

Filled in by respondent in nearly every module.

Details

Individual dollar-value cleaning is performed according to a subjective "smell-test". This is to control for extremely large outliers which are, generally, the result of misplaced decimal points. Original dollar amounts are maintained in the variable `amnt_orig`. Data users may notice that some large transactions have been maintained. This is usually because we were able to confirm that they are genuine.

[Back to top](#)

N	min	med	mean	max	sd
16212	0.01	27.75	219.79	168000	1877.4

Transaction-level Variables

amnt_orig

Description

Dollar amount of the transaction, uncleaned.

Survey Question

Filled in by respondent in nearly every module.

Details

Uncleaned values. See `amnt` for cleaned values.

1 Yes

[Back to top](#)

bill

Description

Whether this transaction was a bill.

Survey Question

pay002, “other” responses.

bill	No.	%
0	9,843	74
1	3,477	26
Total	13,320	100

Details

Question pay002 is used to identify bills reported in the purchases module. All bills reported in the bills reminder module are bills by definition. Observations for which “other” was chosen are manually recategorized. Note that, due to the wording of the question, a very large proportion of respondents (about 25-30 percent) chose “other” and described their payment in words. We attempted to come up with rules for recategorizing these responses, as there were too many to do each one individually.

Coding

- 0 No
- 1 Yes

[Back to top](#)

bill_imp

Description

Whether this transaction was originally reported as a bill in the diary or changed to a bill during the data cleaning process.

bill_imp	No.	%
1	98	100
Total	98	100

Survey Question

pay002, or the various text entry fields in the diary.

Details

If the respondent typed certain key words – such as “rent” or “bill” – into the “other” field of pay002, the transaction was recategorized as a bill. Additionally, in some special cases, transactions were recategorized as bills due to other information elsewhere in the diary.

from_account

Description

The account from which the funds for this transaction were sourced.

Survey Question

N/A

Details

`from_account` and `to_account` are purely constructed variables which tracks the movement of money between accounts, as well as tracking which accounts expenditures came from and which accounts income went to. They should generally be used in conjunction with `type` to truly understand the movement of money.

<code>from_account</code>	No.	%

payment

Description

Whether the transaction is a payment. A payment is defined as a transaction with a non-missing payment instrument. It may, in some cases, be an asset transfer – for instance, if a person uses a debit card to buy a bond – or it may be an expenditure – buying a cup of coffee with cash. It does not, however, include direct transfers from one owned account to another.

payment	No.	%
0	2,854	18
1	13,357	82
Total	16,211	100

Survey Question

submerch

Description

A more specific set of merchant categories, where possible. The variable *submerch* is based on four followup questions which are reached when the respondent chooses merchants "Medical care provider", "Retail store or online retailer", or "Other merchant". Note that "Other merchant" does not appear in the final version of the dataset, as all of the transactions were recategorized based on the followups.

Survey Question

pay030, pay600, pay602, pay090

Details

In general, the diary has two kinds of merchant followups: "who did you pay" and "what did you buy". This variable is constructed based on the response to the "who did you pay" followup responses. *pay030* responses 1 through 4 are given their own categories, as are all *pay600* responses excluding 4 (which is given a subpurpose code). Other than that, it is based entirely on responses to *pay090*.

[Back](#)

[to top](#)

submerch_orig

Description

The original submerchant that the respondent used to report the payment, without any recategorization. Note that some of the information used to recategorize responses is not available for privacy reasons. As such, using `submerch` is recommended.

Survey Question

`pay030`, `pay600`, `pay602`, `pay090`

Details

In general, the diary has two kinds of merchant followups: "who did you pay" and "what did you buy". This variable is constructed based on the response to the "who did you pay" followup responses. `pay030` responses 1 through 4 are given their own categories, as are all `pay600` responses excluding 4 (which is given a subpurpose code). Other than that, it is based entirely on responses to `pay090`.

[Back to top](#)

subpurpose

Description

A more specific set of purpose categories, where possible. Missing values of subpurpose should be interpreted to mean that no more specific categorization of this transaction's purpose is possible. They should not be interpreted to mean that the transaction does not belong in any of the other categories. For example it is entirely possible that a transaction with purpose code 1 and a missing subpurpose category is a mortgage payment, even though mortgage is one of the possible subpurpose categories.

Survey Question

pay010, pay020, pay030, pay040, pay041, pay050, pay082, pay090, pay700, as well as the bill reminder categories

Details

In general, the diary has two kinds of merchant followups: "who did you pay" and "what did you buy". This variable is constructed based on the response to the "what did you buy" followup responses. A complete treatment of the mapping between the various questions and their ultimate codings cannot be given here. However, careful study of the questionnaire and the values of this variable should make it clear how the responses were categorized.

time

Description

The time of the transaction.

Survey Question

Clock widget in the various modules.

Details

Coded simply as a 24-hour clock – i.e. a value of 0 is midnight, 100 is 1 AM, 1400 is 2 PM, etc.

[Back to top](#)

to_account

Description

The account to which the funds for this transaction were transferred.

Survey Question

N/A

Details

from_account and to_account are purely constructed variables which tracks the movement of money between accounts, as well as tracking which accounts expenditures came from and which accounts income went to. They should generally be used in conjunction with type to truly understand the movement of money.

to_account	No.	%

[Back to top](#)

type

Description

The type of transaction – expenditure, transfer, or income. Also identify placeholder observations.

Survey Question

In some cases, based purely on the module in which the transaction is reported. In other cases, based on the response to followup questions.

type	No.	%
0	11,393	41
1	12,410	45
2	1,885	7
3	1,916	7
Total	27,604	100

Details

Expenditures are defined as money or liquidity moving out of a respondent's possession. Transfers are defined as money or liquidity moving from one account/form to another – for instance, a cash withdrawal. Income is defined as money coming into the respondents possession. Expenditures typically come from the purchases or bills modules, income from the income module, and transfers from the rest of the modules, though there are some exceptions.

Placeholder observations are added for every respondent-day, and exist to allow for easier filtering of variables without having to worry about accidentally removing respondents from the dataset.

[Back to top](#)

date

Description

The date of the diary day. Each diarist participated in the diary for four consecutive days, with efforts made to ensure a representative sample of Americans on any given day. The dates range from September 28th, 2016 to November 2nd, 2016. In order to ensure the representativeness of the sample and to eliminate any biases from diary fatigue, it is recommended that only dates in October be considered.

Survey Question

N/A

Details

In most cases, this variable is determined by the date on which the transaction was reported. For some bills, the date is reported by the respondent on diary day 3 and reassigned ex-post.

[Back to top](#)

acct_mostused1

ind_weight

Description

Raked individual sample weights.

Survey Question

N/A

Details

Raked post-stratification weights. Individual weights are best used for producing full-sample full-period estimates. These particular daily weights correspond to `rps_w_uasgfk` in the `full_weights` dataset. See Angrisani, M, 2015 Survey and Diary of Consumer Payment Choice Weighting Procedure (2016) for more information about the construction of the weights.
