Financing Constraints and Unemployment: Evidence from the Great Recession

Burcu Duygan-Bump, Alexey Levkov, and Judit Montoriol-Garriga

Federal Reserve Bank of Boston and Universitat Autonoma de Barcelona

28 October 2011
BU/Boston Fed Conference
The views expressed here are solely those of the authors and do not necessarily reflect official positions of the Federal Reserve Bank of Boston or the Federal Reserve System.
Lending to small businesses declined from $710\text{bil.}$ to $670\text{bil.}$ (Q2:2008 - Q1:2010).

80% of all firms in the economy have < 9 employees.

Small firms employ about 50% of all non-farm private sector workers.

What are the macroeconomic implications of a reduction in small business lending?

- Is there an impact on unemployment?
Number of Small-Business Loans and Employment in Small Firms

Source: Federal Deposit Insurance Corporation and Quarterly Census of Employment and Wages.
Lending and unemployment can be related through,

- changes in the supply of credit,
- changes in the demand for credit,
- or, something unobserved.

We have no data that link borrowers and lenders.
We estimate the impact of changes in lending on unemployment, using a quadruple difference approach.

Exploit variation across:

- **time**: we look before and after the 2007-09 recession to capture the period of declining lending to small businesses.
- **firm size**: if changes in lending to small firms affect unemployment, we expect a more pronounced effect on small firms.
- **external financial dependence**: only firms that need to raise external finance should be affected.
- **recessions**: we examine three recessions.
Likelihood of Switching from Employment to Unemployment

Low External Financial Dependence

High External Financial Dependence

Specification of interest is,

\[(E \Rightarrow U)^d_{ijst} = \alpha_j^d + \lambda_{sj}^d + \theta^d x_{ijst} + \beta^d rec_t +
\]
\[+ \mu^d small_{ijst} + \rho^d (rec_t \times small_{ijst}) + u_{ijst}^d,
\]

- \(i\)-person, \(j\)-industry, \(s\)-state, \(t\)-time.
- \(d = \{high, low\}\) indicates external financial dependence.
- We are interested in \(\hat{\rho}^{high} - \hat{\rho}^{low}\).
- We adjust the standard errors for potential within-group correlation of \(u_{ijst}\).

- official source of U.S. unemployment statistics.
- (un)employment status, industry, geography, demographics.
- this paper: private sector workers, ages 16-65.
- “What was the size of your main employer in the previous year?”
  - conditional on having an employer in the previous year.
- "Are you employed now?"
  - “No” means switched from employment to unemployment/NILF.
• CPS (worker level): (un)employment status, firm size \((t - 1)\), industry, demographics.

• COMPUSTAT (firm level): % of capital expenditures financed with external funds, industry.

\[
\frac{\text{capital expenditures} - \text{cash flows}}{\text{capital expenditures}}
\]

• Measures demand for external finance.
• Negative when the median firm in the industry has free cash.
• Technology is the reason for cross-industry differences in external financial dependence (Rajan and Zingales, 1998).

In a recession, industry-wide demand for goods and services declines.

- compare small and large firms within the same industry.
- control for lag of region-specific growth rate of real per capita income.

Within an industry, small firms may face a larger decline in demand for their products.

- has to be primarily in industries with high external financial dependence.
- has to be monotonic with respect to firm size and external financial dependence (next slides).

We repeat the analysis around the 1990 and 2001 recessions.

</tbody>
</table>

Note – The dependent variable is the natural logarithm of the number of establishment per capita in an industry/state/year. The recession indicator equals to one in the years 2008 and 2009 and equals to zero in the years 2005-07. “Small” firms are firms with 1-99 employees; “Large” firms are firms with 100+ employees. External financial dependence equals the proportion of capital expenditures financed with external funds. It is calculated using mature Compustat firms in the period 1980-1996 using the procedures described in Cetorelli and Strahan (2006). “Low” external financial dependence means that firms have free cash; “High” external financial dependence means that firms need to issue debt or equity to finance their investment. All regressions include state-industry fixed effects. Number of establishments is from County Business Patterns for the years 2005-2009. Population estimates are from the U.S. Census Bureau. Standard errors are adjusted for clustering at the state level and appear in parentheses. *** indicates statistical significance at the 1%.
• Likelihood of unemployment increases in small firms more than in large firms ONLY in industries with **high external financial dependence**.
  • Results hold for 2007-09 and 1990-91 recessions.
  • Results do not hold for 2001 recession.

• **Continuity** by firm size and external financial dependence.

• Similar results for the number of **establishments**.

Note - The dependent variable is an indicator that equals to one if a person is unemployed. The table reports Ordinary Least Squares estimates. Standard errors are adjusted for clustering at 2-digit Standard Industrial Classification code and appear in parentheses. The sample includes respondents to the March Current Population Surveys (CPS) in the years 2005-2009. Information about each worker’s employer size is available for the year prior to the survey, i.e., 2004-2008. The sample is limited to adult civilians aged 16-65 in the year of the survey and excludes workers in the military, the public sector, and the financial sector. Additionally, we exclude the construction sector. External financial dependence equals the proportion of capital expenditures financed with external funds. A negative value indicates that firms have free cash flow, whereas a positive value indicates that firms must issue debt or equity to finance their investment. External financial dependence is calculated using mature COMPUSTAT firms for the period 1980-1996. Mature firms are firms that have been on COMPUSTAT for at least 10 years. Recession equals to one in the years 2008 and 2009. Small firms have at most 499 employees. Large firms have at least 500 employees. All specifications control for workers’ characteristics which include: age, gender, ethnicity (white indicator), and indicators of years of completed education (0-11, 12, 13-15, 16, and 17+). The specifications also control for region fixed effects (New England, Middle Atlantic, East North, West North, South, East South, West South, Mountain, and Pacific), industry fixed effects (manufacturing non-durable goods, manufacturing durable goods, trade, services, and other), and metropolitan area growth rate of household income over the period 2004-2008. All estimates are weighted by probability sampling weights provided by the CPS. * and *** indicate statistical significance at the 10% and 1% levels, respectively.

</table>

Note - This table reports measures of external financial dependence (EFD) for each industry at the 2-digit SIC category. External financial dependence equals the proportion of capital expenditures financed with external funds. A negative value indicates that firms have free cash flow, whereas a positive value indicates that firms must issue debt or equity to finance their investment. External financial dependence is calculated using mature COMPUSTAT firms for the period 1980-1996. Mature firms are firms that have been on COMPUSTAT for at least 10 years.
### Characteristics of Compustat Firms by External Financial Dependence

<td>-.066</td>
</tr>
<tr>
<td>Sales growth</td>
<td>.062</td>
<td>.044</td>
<td>-.017</td>
</tr>
</tbody>
</table>

Note - The table reports characteristics of Compustat firms by external financial dependence of their industry. Column (3) reports the difference between the first two columns. Robust standard errors are in parentheses. The table is based on 4,708 mature Compustat firms in the years 1980-1996. Mature firms are firms that have been on Compustat for at least 10 years. The growth rates of assets, capital expenditures, and sales are median values of year-to-year real ($1997, CPI adjusted) growth rates over the period 1980-1996. External financial dependence equals the proportion of capital expenditures financed with external funds. A negative value (low external financial dependence) indicates that firms have free cash flow. A positive value (high external financial dependence) indicates that firms must issue debt or equity to finance their investment. External financial dependence is calculated at a 2-digit Standard Industrial Classification codes using mature Compustat firms for the period 1980-1996.
