# DISCUSSION OF: <br> "Where Have All the Workers Gone?" 

Gabriel Chodorow-Reich<br>Harvard University

Federal Reserve Bank of Boston<br>October 14, 2016

## OvERVIEW OF COMMENTS

(1) Mechanical composition versus within age-sex changes.
(2) Labor supply decision.
(3) Prime-age workers.

- Heterogeneity within group important.
- Role of disability.
- Role of family structure.
(9) Well-being.

## Age-sex demographic composition

## Age-sex demographic composition

## Age-sex demographic composition

## Age-sex demographic composition

## FEmALE COHORT EFFECTS

- 55-64 year old trend from 1997 to 2007 is 1941 versus 1951 cohort. Should not extrapolate to 1961 cohort.

## Age-sex demographic composition

## Age-sex demographic composition

## ECONOMICS: STATIC FOC FOR PARTICIPATION

With no search costs, indivisible labor $\ell \in\{0,1\}$, separable period utility $u(c)-\phi \mathbb{I}\{\ell=1\}$, no skill or asset accumulation, work if:

$$
\begin{aligned}
\frac{\phi}{u^{\prime}(c)}+b & \leq(1-\tau) w, \\
w & =\mathscr{M}^{-1} M P L .
\end{aligned}
$$

- LFPR defined by individual who satisfies with equality.
- $\phi$ : Work painful (disability?) or leisure valuable (video games?).
- $u^{\prime}(c)$ : Wealth effect (benign?).
- b: Transfers (SSDI?).
- $(1-\tau)$ : Labor income taxes.
- $\mathscr{M}$ : Firm markup (lower labor bargaining power or minimum wage?).
- MPL: Marginal product of labor (SBTC? disability?).

## What are they doing and will they return?

|  | Male 35-54 pop. share (\%) |  |  | NE hazard (\%) |  |  |
| :--- | ---: | ---: | ---: | :--- | ---: | ---: |
|  | 2007 | 2016 | Difference |  | 2015 | 2000 |
| Want Job | 1.2 | 1.4 | +0.25 |  | 19.9 | 22.2 |
| School | 0.4 | 0.6 | +0.17 |  | 19.6 | 24.6 |
| Other | 0.9 | 1.1 | +0.21 |  | 17.8 | 19.1 |
| House | 0.8 | 1.2 | +0.44 |  | 12.3 | 17.9 |
| Retired | 1.2 | 1.5 | +0.30 |  | 5.1 | 4.1 |
| Disabled | 5.3 | 5.8 | +0.52 |  | 2.3 | 2.8 |
| Total NILF | 9.8 | 11.7 | +1.89 |  |  |  |

- Modest scope for tighter labor market to raise reemployment rates.
- Retired and disabled $44 \%$ of increase. Mostly permanent.

## What are they doing and will they return?

|  | Male $25-34$ pop. share (\%) |  |  | NE hazard (\%) |  |  |
| :--- | ---: | ---: | :---: | ---: | :---: | :---: |
|  | 2007 | 2016 | Difference |  | 2015 | 2000 |
| Want Job | 1.6 | 2.1 | +0.47 |  | 19.4 | 30.9 |
| Other | 1.0 | 1.4 | +0.33 |  | 16.9 | 25.8 |
| House | 0.9 | 1.1 | +0.21 |  | 16.8 | 21.7 |
| School | 1.8 | 3.0 | +1.15 |  | 11.1 | 15.9 |
| Retired | 0.3 | 0.5 | +0.23 |  | 6.9 | 24.3 |
| Disabled | 2.1 | 3.0 | +0.90 |  | 3.0 | 4.8 |
| Total NILF | 7.8 | 11.1 | +3.30 |  |  |  |

- Modest scope for tighter labor market to raise reemployment rates.
- School $35 \%$ of increase.

## Role of disability

$$
\frac{\phi_{a g e=a, h e a l t h=h, \text { time }=t}}{u^{\prime}\left(c_{a, h, t}\right)}+b_{h, t} \leq\left(1-\tau_{h, t}\right) \mathscr{M}_{t}^{-1} M P L_{a, h, t}
$$

- Distribution of $h \mid a$ : higher participation among 60+ suggests improving health.
- $\phi_{a, h, t}$ : Harder to work with disability? Seems unlikely: ADA, etc.
- $M P L_{a, h, t}$ : Productivity of disabled? Shift to services, non-manual work should have facilitated participation of moderately disabled.
- $b_{h, t}$ : DI benefits more generous (Autor and Duggan).
- Maestas, Mullen, Strand (2013), French, Song (2014), Autor, Maestas, Mullen, Strand (2013) quasi experimental evidence using administrator/judge assignment: at most about $1 / 4$ to $1 / 2$ of SSDI recipients would otherwise work.

## Krueger evidence on health status

- $43 \%$ of prime-age men NILF report health as fair or poor.
- $34 \%$ say yes to at least one of six disabilities asked by CPS.
- Probability NILF|disabled $\uparrow$ from 2008 to 2014, $\downarrow$ from 2014 to 2016.
- Useful to further restrict age - different for 45 year old than 30 year old.
- Prime-age male NILF (disabled) spend $1 / 2$ (71\%) of day in some pain. Pain rating higher for NILF.
- $44 \%$ of prime-age male NILF take some pain medication.
- Self-reporting: 93\% of disabled NILF receiving income support say they would not otherwise work.

## Role of disability

$$
\frac{\phi_{a g e=a, h e a l t h=h, \text { time }=t}}{u^{\prime}\left(c_{a, h, t}\right)}+b_{h, t} \leq\left(1-\tau_{h, t}\right) \mathscr{M}_{t}^{-1} M P L_{a, h, t}
$$

- Distribution of $h \mid a$ : higher participation among 60+ suggests improving health.
- $\phi_{a, h, t}$ : Harder to work with disability? Seems unlikely: ADA, etc.
- $M P L_{a, h, t}$ : Productivity of disabled? Shift to services, non-manual work should have facilitated participation of moderately disabled.
- $b_{h, t}$ : DI benefits more generous (Autor and Duggan).
- Maestas, Mullen, Strand (2013), French, Song (2014), Autor, Maestas, Mullen, Strand (2013) quasi experimental evidence using administrator/judge assignment: at most about $1 / 4$ to $1 / 2$ of SSDI recipients would otherwise work.

## Not in Labor force by family structure

Men 35-44

Men 45-54

- No spouse or children under 18
-------- Spouse, no children under 18 --- Spouse, children under 18
- Married with children have highest LF attachment and smallest decrease.
- Unmarried men have lowest LF attachment.

## FAMILY STRUCTURE BY AGE-SEX CATEGORY

Men 35-44

Men 45-54

- No spouse or children under 18
-------- Spouse, no children under 18

No spouse, children under 18
--- Spouse, children under 18

- Shift toward family structures with lower male labor force attachment.

## Not in Labor force by family structure

Women 35-44

Women 45-54

- No spouse or children under 18 Spouse, no children under 18

No spouse, children under 18
--- Spouse, children under 18

- Increase in out of labor force in past 20 years not concentrated among women with children.

## WELL-BEING ("How does it FEEL?")

Cantril ladder by spousal employment

| Spouse: | Men 25-54 |  |  |  | Women 25-54 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No spouse | Emp. | Not emp. | Total | No spouse | Emp. | Not emp. | Total |
| Respondent: |  |  |  |  |  |  |  |  |
| Employed | 6.55 | 7.25 | 7.21 | 7.03 | 6.77 | 7.56 | 6.93 | 7.24 |
| Not in LF | 5.73 | 6.68 | 6.22 | 6.08 | 6.17 | 7.50 | 6.51 | 7.03 |

Cantril ladder 0-10 with 10 the best possible life and 0 the worst.

- Without spouse less satisfied with life.
- Conditional on spouse present, decline in well-being among NILF smaller if spouse working than not. Income effects?

## Conclusions

(1) Age-sex explains a lot.
(2) Disability important, but may matter along many dimensions.
(3) Family structure important.
(1) Presence of children, spouse suggestive of income effects.

Appendix slides

## What are they doing and will they return?

|  | Female $35-54$ pop. share (\%) |  |  | NE hazard (\%) |  |  |
| :--- | ---: | ---: | :--- | :--- | :--- | ---: |
|  | 2007 | 2016 | Difference |  | 2015 | 2000 |
| Want Job | 1.8 | 2.1 | +0.30 |  | 13.8 | 14.9 |
| Other | 1.1 | 1.1 | +0.05 |  | 13.7 | 17.2 |
| School | 0.7 | 0.8 | +0.07 |  | 10.4 | 8.5 |
| House | 13.2 | 13.7 | +0.58 |  | 5.8 | 6.3 |
| Retired | 1.6 | 1.7 | +0.14 |  | 5.2 | 4.5 |
| Disabled | 5.9 | 6.5 | +0.59 |  | 2.1 | 2.0 |
| Total NILF | 24.2 | 26.0 | +1.73 |  |  |  |

## What are they doing and will they return?

|  | Female $25-34$ pop. share (\%) |  |  | NE hazard (\%) |  |  |
| :--- | ---: | ---: | ---: | :--- | ---: | ---: |
|  | 2007 | 2016 | Difference |  | 2015 | 2000 |
| Other | 1.0 | 1.2 | +0.17 |  | 14.7 | 17.1 |
| Want Job | 2.5 | 2.8 | +0.29 |  | 14.5 | 17.4 |
| School | 2.7 | 3.4 | +0.67 |  | 8.5 | 10.5 |
| Retired | 0.4 | 0.7 | +0.30 |  | 6.1 | 18.9 |
| House | 16.6 | 15.4 | -1.27 |  | 5.1 | 6.1 |
| Disabled | 2.3 | 2.5 | +0.23 |  | 3.4 | 4.2 |
| Total NILF | 25.5 | 25.9 | +0.40 |  |  |  |

## HAZARD INTO EMPLOYMENT, 35-54 YEAR-OLD MEN

- NILF, want job similar to long-term unemployed.
- NILF, disabled rarely reenter employment.

## HAZARD INTO EMPLOYMENT, 35-54 YEAR-OLD WOMEN

- NILF, want job similar to long-term unemployed.
- NILF, disabled rarely reenter employment.
