Before the 1800s—back before government, nonprofit foundations, and think tanks began to involve themselves in large-scale antipoverty initiatives—there was little interest in measuring poverty, mainly because there was no real need for measurement. For most of human history religious organizations, local politicians, and the landed gentry dispensed small amounts of largesse to those who were lucky enough to gain favor or notice.

Even the charitable efforts of 19th century antipoverty reformers were smaller-scale local operations that mostly provided meals, clothing, and other forms of aid directly to needy people in a defined area. Donors to those charities rarely required more than a rough tally of meals served or people helped.

In 1869 Massachusetts established the first labor statistics bureau with a goal of using government statistics to help improve the lives of working class families. And in 1900, the English chocolatier and social researcher Benjamin Seebohm Rowntree published Poverty: A Study in Town Life, based on statistical research he had undertaken in York. But for the most part, efforts to define and measure poverty did not gain momentum until the 1930s, when the federal government engaged in large-scale relief efforts aimed at easing the effects of the Great Depression, and then later in the 1960s, when President Lyndon Johnson declared war on poverty.

**You Know You’re Poor If …**

Some call it the “poverty line,” others refer to it as the “poverty threshold.” In either case, there is general agreement that Mollie Orshansky, a statistician at the Social Security Administration, developed the federal government’s first widely used measure of poverty. This is how it happened:

By 1963, Orshansky was working for the Social Security Administration – the agency that oversees many social safety net programs – and was assigned to report on “poverty as it affects children.” But her team had no good measure of what constituted poverty — so Orshansky decided to develop her own.

She used a 1955 Department of Agriculture report which found that families of three or more spent about one third of their after-tax income on food. So, to calculate a poverty line Orshansky decided to multiply a low-income household’s food budget by three, figuring that if a family was tightening its belt, it would cut all expenses by about the same amount, proportionately.

For the food budget itself, Orshansky used the Department of Agriculture’s “economy food plan.” It was the cheapest of four plans developed by the Department of Agriculture, and was designed to reflect what a family living for a short period of time on a severely constrained budget might need to get by. In 1962, it allotted $18.60 a week for a family of four with two school-aged children—or $143.47 in today’s dollars. It was even less costly than two other “low cost” plans the department had developed, and, as a 1962 report explained, “relie[d] heavily on the cereals, dry beans, peas, and nuts and potato groups, and on the selection of the less expensive items in each of the 11 food groups.” It was only for “emergency use,” and not intended to constitute a family’s diet over the long-term. In a 1965 article, Orshansky said her threshold, dependent on this budget, should be used to measure when a family had “inadequate” funds, not adequate funds.

Her new standard came at a fortuitous time. The Johnson administration had declared a “war on poverty,” and public agencies needed a way to measure the extent of the problem. In 1965, the Office of Economic Opportunity adopted Orshansky’s thresholds as their poverty cut-off, and in 1969, her thresholds were made the government’s official definition of poverty.

Aside from updates for inflation, the federal poverty threshold has changed little since the 1960s, and that has been a point of contention. The most frequent criticism is that the federal poverty threshold counts only cash income and does not take into account programs intended to counter the effects of poverty programs such as the Supplemental Nutrition Assistance Program (SNAP) or the Earned Income Tax Credit.

Even Orshansky herself had reservations. “The best that can be said about the measure,” she once wrote, “is that at a time when it seemed useful, it was there.” 16

In addition to the federal poverty threshold, there are federal poverty guidelines. The Federal Poverty Guidelines (Federal Poverty Levels, FPL) are the official measure of the minimum income needed to meet the basic needs of individuals and families. The amounts are often used to set eligibility and benefits for public programs. But numerous studies have documented that the FPL is an outdated and inaccurate reflection of the actual incomes families need. It is also a poor metric to identify the economic needs of custodial grandparents. 17 A detailed explanation of the difference between the threshold and guidelines is available here.

The Supplemental Poverty Measure (SPM) was developed to address FPL shortcomings, but being based on current spending, it doesn't necessarily measure actual need. It includes people who spend only $100 on food per month, but that amount may represent food insecurity. A better way to measure economic security is to capture the actual costs associated with basic needs, such as shelter, food, health care, and transportation. 18

Despite acknowledged shortcomings, proposals to change the federal poverty threshold and other federal poverty measures have run up against political pushback and disagreements over how to define poverty. The following online resources provide clear, concise summaries of the complexities involved ... and they spare us the danger of navigating those particular political and ideological shoals:

What’s the Best Way to Measure Poverty: Income or Consumption?
Matthew Phillips, Freakonomics blog

The Mismeasure of Poverty

Communities & Banking
A quarterly magazine from the Federal Reserve Bank of Boston, Communities & Banking offers insightful articles on a variety of topics that affect the lives and fortunes of low- and moderate-income people.
There are also a variety of alternative measures that seek to evaluate well-being rather than trying to define poverty. 

**The Genuine Progress Indicator (GPI)** focuses on “the quality of life we create not only for ourselves but for everyone with whom we share the planet” by measuring factors such as crime and family breakdown, household and volunteer work, income distribution, and pollution.

**The Human Development Index (HDI)** offers a global perspective on the question of how well people are living. Devised by the United Nations in the 1990s, the HDI is a composite of three different indicators: (1) life expectancy at birth, (2) education as measured by a combination of school enrollment and adult literacy, and (3) standard of living as measured by a variation on GDP per capita that adjusts for price differences between countries (purchasing power parity in U.S. dollars).

**Index of Social Health** is “a broad-based gauge of the social well-being of the nation, similar in concept to the Dow Jones Average or the Gross Domestic Product.” Published annually since 1987, the index uses government data for 16 social indicators to create profiles and rankings for all 50 states. In 2008, Minnesota ranked number one with a score of 75 out of 100, and New Mexico finished at the bottom with a score of 26.8.

**The Elder Economic Security Standard Index** is an evidence-based measure of economic security that reflects the current actual cost of basic needs at the county level for retired adults age 65 and over, who receive no public assistance. The index was developed by Wider Opportunities for Women and the University of Massachusetts, Boston, Gerontology Institute to address the failings of the FPL for older adults. The UCLA Center for Health Policy Research and the Insight Center for Community Economic Development adapted the index and calculated it for California. As of September 2011, California law requires Area Agencies on Aging to use the index for program and planning purposes.

Collecting data is an important tool in the overall effort to understand and alleviate poverty, but as columnist Mark Shields likes to say, “Numbers don’t bleed.” Maybe that is why some of the most effective vehicles for raising awareness of poverty and sparking action to address it have combined compelling narrative with powerful visuals. Here are five:

**How the Other Half Lives**, Jacob Riis, 1890

More than a century before anyone expressed concern for the 99 percent, Jacob Riis created an eye-opening account of “how the other half lives.” Riis used the skills he had acquired working as a police reporter, combined with the relatively new technology of flash photography, to create a late 19th century account of life in the squalid slums of New York.

**Photographs of the Un-rich and the Un-famous: Lewis Hine**

Lewis Hine (1874-1940) photographed people whose lives were a constant struggle to make ends meet: children who spent 12-hour days inside factory walls, newsies who lived on the streets and survived by their wits, immigrants who tried their best to make sense of a strange new land, and hundreds or even thousands of men and women who worked long hours for short money. Hine’s images truly are haunting; once you see them, they stay with you for life. (See also: [http://digitalgallery.nypl.org/nypldigital/explore/dgexplore.cfm?col_id=175](http://digitalgallery.nypl.org/nypldigital/explore/dgexplore.cfm?col_id=175).)

**Let Us Now Praise Famous Men**, James Agee and Walker Evans, 1941

James Agee was the writer, Walker Evans the photographer. *Fortune* magazine brought them together in 1936 for an eight-week assignment to document the lives of sharecropping families in rural Alabama. Their work formed the basis for *Let Us Now Praise Famous Men* published in 1941. To read Agee’s prose and look upon Evans’s images is to gain an inkling of what it must mean to face each day with little hope and even less money.

**CBS News Harvest of Shame, 1960**

Back before they decided that “reality” meant putting various groups of narcissistic adults in front of a TV camera, the networks did some pretty good reporting on issues related to poverty. *Harvest of Shame* was one of the standouts. The 55-minute CBS News documentary focused on the plight of migrant workers, who, in the words of CBS correspondent Edward R. Murrow, were “the forgotten people; the under-educated; the under-fed.”

**Paycheck to Paycheck**, HBO, 2014

If you are thinking that all the good reporting on poverty took place back in some golden age that never was, you should set aside an hour of your life to watch *Paycheck to Paycheck: The Life and Times of Katrina Gilbert*. Produced in association with The Shriver Report: A Woman's Nation Pushes Back from the Brink, it follows a “single Tennessee mom through her day-to-day life, as she works full time as a certified nurse's assistant but has to choose between paying for her medication and finalizing her divorce.” And if you can't watch the show, here’s an alternative suggestion: Try spending a week or two living on $9.49 an hour.
