Measuring Income and Wealth at the Top Using Administrative and Survey Data

Jesse Bricker
Alice Henriques
Jacob Krimmel
John Sabelhaus

Presentation prepared for Frontiers of Measuring Consumer Economic Behavior, Federal Reserve Bank of Boston, April 27, 2015. The analysis and conclusions set forth are those of the author and do not indicate concurrence by other members of the research staff or the Board of Governors of the Federal Reserve System.
Motivation

• Top income and wealth shares: high and rising

• Both normative and policy concerns
  o Is the world becoming less fair? If so, why?
  o Has inequality contributed to macro instability and/or slowed economic growth?

• Not just academic debates, bestsellers!
  o Rajan (2010), Stiglitz (2012), Piketty (2014)
Goals for this Paper

• U.S. top income and wealth shares are high and rising, but how high, and how fast?

• Widely-cited top shares estimates based on administrative income tax data diverge from Survey of Consumer Finances (SCF)
  o Piketty and Saez (2003, updated)
  o Saez and Zucman (2014)

• Primary goal is to understand why the two approaches diverge, and solve for biases
Why Might Different Approach Matter?

• SCF samples the population and validates representativeness with same administrative data
  o SCF top shares lower/growing more slowly
  o Does this mean SCF \textit{not} capturing top shares?

• Could also be problems with tax-based estimates
  o Unit of observation is not households
  o Income and wealth concepts limited by tax system
    • \textit{Unmeasured} incomes and wealth are not distributed the same as measured components
  o Aggregate benchmarks matter, especially for wealth
  o Transitory income fluctuations distort very top shares
SCF and Administrative Data: Top 1% Income Shares

Sources: Survey of Consumer Finances (SCF) and Piketty and Saez (2003 + updates). SCF incomes are collected for the calendar year prior to each triennial survey. See Appendix B for details on Administrative, SCF Bulletin, and SCF Market income concepts. Income thresholds for identifying the top 1% of households and tax units are reported in Appendix C.
SCF and Administrative Data: Top 0.1% Income Shares

Sources: Survey of Consumer Finances (SCF) and Piketty and Saez (2003 + updates). SCF incomes are collected for the calendar year prior to each triennial survey. See Appendix B for details on Administrative, SCF Bulletin, and SCF Market income concepts. Income thresholds for identifying the top 0.1% of households and tax units are reported in Appendix C.
Sources: Survey of Consumer Finances (SCF) and Saez and Zucman (2014). See Appendix B for details on SCF and FA wealth concepts. Wealth thresholds for identifying the top 1% of households and tax units are reported in Appendix C.
SCF and Administrative Data: Top 0.1% Wealth Shares

Sources: Survey of Consumer Finances (SCF) and Saez and Zucman (2014). See Appendix B for details on SCF and FA wealth concepts. Wealth thresholds for identifying the top 1% of households and tax units are reported in Appendix C.
Road Map for Paper

I. Introduce SCF sampling and validation
   o Participants and non-participants look the same

II. Reconcile top 1%, 0.1% income shares
   o Tax units vs households, income concepts

III. Reconcile top 1%, 0.1% wealth shares
   o Tax units vs households, wealth concepts
   o Benchmarking to wealth aggregates, Forbes 400

IV. Show how SCF sampling goal of finding *permanently* wealthy affects very top shares
I. Introduce SCF sampling and validation
   - Participants and non-participants look the same

II. Reconcile top 1%, 0.1% income shares
    - Tax units vs households, income concepts

III. Reconcile top 1%, 0.1% wealth shares
    - Tax units vs households, wealth concepts
    - Benchmarking to wealth aggregates, Forbes 400

IV. Show how SCF sampling goal of finding permanently wealthy affects very top shares
III. Wealth Reconciliation

- Why do SCF and tax-based “Gross Capitalization” top wealth share estimates diverge?
  - Capitalized approach uses taxable SOI incomes for income-generating assets, imputations for rest
  - Capitalized calibrated to Financial Accounts (FA)
  - SCF and FA balance sheet concepts diverge
  - SCF and FA estimated aggregates diverge
  - Some implied capitalization factors problematic

- 160 million tax units versus 120 million families

- SCF (by rule) does not survey Forbes 400
Gross Capitalization (GC) Approach

• Given taxable capital income type $k=1,...,9$ along with estimates of wealth that do not generate taxable income, for family $i$

$$\text{wealth}_{i}^{GC} = \sum_{\forall k} \frac{SOI \text{ income}_{i}^{k}}{ror^{k}} + \text{nonfinancial}_{i}$$

• In practice, Saez and Zucman (2014) compute $ror$ for each asset $k$ to calibrate to FA aggregates

$$ror^{k} = \frac{\sum_{\forall i} SOI \text{ income}_{i}^{k}}{FA \text{ asset}_{k}^{k}}$$

95% Confidence Interval on Reconciled Top 1% Wealth Shares

- Administrative Data
- SCF Bulletin Wealth, Households
- SCF Benchmarked to FA Values, Tax Units, Plus Forbes 400
Decompose Top 1% Wealth Shares: Top 1-0.1 % (99-99.9\textsuperscript{th} percentile)
Decompose Top 1% Wealth Shares: Top 0.1%

Administrative Data
SCF Bulletin
SCF Benchmarked to FA Values, Tax Units, Plus Forbes 400
Wealth Reconciliation at the Very Top

• Still, top 0.1 wealth share is greater in capitalized administrative tax data

• Look closer at asset composition and RoR
  o Fixed-income assets were 25%, now 45% of assets
Administrative Data -- Top 0.1% Asset Composition

- Housing
- Pension
- Equity + Business
- Fixed Income Assets
Wealth Reconciliation at the Very Top

• Still, top 0.1 wealth share is greater in capitalized administrative tax data

• Look closer at asset composition and RoR
  o Fixed-income assets were 25%, now 45% of assets
  o Bonds ≈ 1/3rd, deposit accounts are the other 2/3rds.
  o Do the top 0.1 really hold savings deposit accounts?

• Rate of return on fixed-income = 1 pct. (for all)
  • → capitalization factor of 100x for interest income
  • Compare to market rates of return
Capitalize Top 0.1% Interest Income with SZ methodology (i.e. 1 pct. RoR in 2012)

Administrative Data

SCF Benchmarked to FA Values, Tax Units, Plus Forbes 400

Sources: Survey of Consumer Finances (SCF) and Saez and Zucman (2014). See Appendix B for details on SCF and FA wealth concepts. Wealth thresholds for identifying the top 1% of households and tax units are reported in Appendix C. Shaded area represents 95% confidence interval based on sampling and imputation variance.
Capitalize Top 0.1% Interest Income with 10-year Treasury Yield (i.e. 2 pct. RoR ‘12)

SCF Benchmarked to FA Values, Tax Units, Plus Forbes 400

Admin Robustness - 10 Year Treasury Yield

Sources: Survey of Consumer Finances (SCF) and Saez and Zucman (2014). See Appendix B for details on SCF and FA wealth concepts. Wealth thresholds for identifying the top 1% of households and tax units are reported in Appendix C. Shaded area represents 95% confidence interval based on sampling and imputation variance.
Wealth Reconciliation Takeaways

• As with income, top 1% levels in 2013 similar, but SCF trends generally flatter
  • All the difference is due to top 0.1 percent

• The same slower top 0.1 wealth shares, growth
  o When assume reasonable capitalization factor for interest income
  o Why? Allocate FA fixed-income assets to those that realize interest income
  o Small balance deposits growing; 1099-INT if ≥ $10
  o Further, the SZ bond series is pre-FA revision!
Conclusions

• Estimates of top income and wealth shares from SCF can be reconciled with estimates derived directly from administrative tax data.

• SCF suggests that administrative-based top share estimates are too high and rising too fast.

• Reconciliations offer direction for future work, as broader income and wealth measures are likely to further reduce estimated top shares.
If Time: Expanded Income Concept

• Cannot distribute all of NIPA personal income, but can at least bracket top income shares

• Assume that missing income in every year, starting in 1970, is allocated per tax unit
  o Top 1 percent gets only 1% of the missing income

• Top 1% income levels and growth much more muted, and tax unit adjustment would add

• Extreme assumption, but brackets truth: missing incomes are transfers, non-wage compensation, retirement saving
Figure 10. Effect of Allocating Missing Personal Income on Top 1% Income Shares

Sources: Bureau of Economic Analysis and Piketty and Saez (2003 + updates). Adjustment assumes all missing NIPA income (government transfers, unreported income, retirement saving, employer-provided health) are allocated to top share group in proportion to numbers of units, not in relation to other incomes. See Appendix B for a discussion of the mismatch between NIPA and administrative data concepts.

Additional Slides
I. SCF Sampling and Representativeness

• Non-participation among wealthy families in traditional household surveys is a problem
  o Indirect evidence: don’t see large incomes, wealth
  o Direct evidence: Sabelhaus et al. (2015)

• SCF solves this by targeting a certain number of cases from very thin strata near the top
  o Accept low response rates, weight accordingly

• Things can go wrong: participants within a given stratum don’t look like non-participants
SCF Respondents are Similar to Non-Respondents by Income Within Top Share Strata

Graphs by Stratum
Mean Incomes within Top Share Strata are Similar for Respondents and Non-Respondents

[Bar chart showing mean incomes for different strata (4th Highest, 3rd Highest, 2nd Highest, Highest) for SCF Respondents and Sampled Non-Respondents.]
Pre-Survey Income Volatility is Similar for Respondents and Non-Respondents

![Bar Chart]

- SCF Respondents
- Sampled Non-Respondents
II. Income Reconciliation

• Comparisons between Piketty-Saez and SCF income shares is “apples-to-oranges”

• First, adjust income concept
  o Strip out “non-market” incomes from SCF

• Second, adjust for tax units vs households
  o In 2013, 160 mill tax units, 120 mill households
  o In adjusted 1% series, just count 1.6 mill from top
Reconciling Survey of Consumer Finances (SCF) and Administrative Data

Wealth thresholds for identifying the top 1% of households and tax units are reported in Appendix C. Shaded area represents 95% confidence interval based on sampling and imputation variance.
IV. Targeting Permanently Wealthy

• Why does SCF find lower and flatter trajectory top 0.1% shares for both income or wealth?

• SCF sampling strategy finds *permanently* wealthy by grossing up capital income *and* empirical correlation between wealth/income

• Predicted wealth based on just gross capitalization too high relative to empirical
Figure 13. Predicted Top 0.1 Percent Wealth Share from Gross-Capitalization and Empirical Correlation Model

Note: Data from first implicate of SCF survey data matched to wealth indices used to stratify the list sample.
Why Does Sampling Matter?

• Samples at very top diverge because of non-income generating wealth and volatility

• Imagine two very wealthy families
  o 50% chance of 2*average income, 50% zero
  o Remember high end volatility figure!

• Gross capitalization model only counts the one who realizes the income, SCF gets both

• Is classification bias increasing over time?
Why Do We Care?

• Are top shares just high and rising, or really high and rising really fast?

• Useful to (1) confirm SCF is capturing high end and (2) understand why administrative and survey-based top share estimates diverge

• Reasons for divergence vis a vis NIPA speak to shortcomings of SCF concepts as well
  o SCF income and wealth also not comprehensive
  o SCF top shares predictably biased up!
